## Welcome!

Congratulations on deciding to continue your learning! We are happy to share this study packet on proportional reasoning. We hope that these materials are helpful in your efforts to earn your high school equivalency diploma. This group of math study packets will cover mathematics topics that we see on high school equivalency exams. If you study these topics carefully, while also practicing other math skills, you will increase your chances of passing the exam.

Please take your time as you go through the packet. You will find plenty of practice here, but it's useful to make extra notes for yourself to help you remember. You will probably want to have a separate notebook where you can recopy problems, write questions, and include information that you want to remember. Writing is thinking and will help you learn.

After each section, you will find an answer key. Try to answer all the questions and then look at the answer key. It's not cheating to look at the answer key, but do your best on your own first. If you find that you got the right answer, congratulations! If you didn't, it's okay. This is how we learn. Look back and try to understand the reason for the answer. Please read the answer key even if you feel confident. We added some extra explanations and examples that may be helpful. If you see a word that you don't understand, try looking at the Vocabulary Review at the end of the packet.

We hope you share what you learn with your friends and family. If you find something interesting here, tell someone about it! If you find a section challenging, look for support. If you are in a class, talk to your teacher and your classmates. If you are studying on your own, talk to people you know or try searching for a phrase online. Your local library should have information about adult education classes or other support. You can also find classes listed here: https://www.acces.nysed.gov/aepp/find-adult-education-program.

You are doing a wonderful thing by investing in your own education right now. You have our utmost respect for continuing to learn as an adult.

Please feel free to contact us with questions or suggestions.

## Best of luck!

Eric Appleton (eric.appleton@cuny.edu) \& Mark Trushkowsky (mark.trushkowsky@cuny.edu) CUNY Adult Literacy and High School Equivalency Program

## Overview

| Prerequisites | There are no prerequisites to Proportional Reasoning, Part 1. As long as you <br> are able to read this packet independently, you don't have to study any <br> other math packets first. <br> Students should complete Proportional Reasoning, Part 1 before working <br> on Proportional Reasoning, Part 2. |
| :--- | :--- |
| Connections | Students can find more opportunity to practice using ratios and <br> proportions in the Fast Track GRASP Math Packets, Being Counted: <br> Probability \& Statistics, Parts 1 and 2. |

In this packet, you will explore concepts in proportional reasoning, including ratios, rates, and proportions.

## In Part 1, you will study the following topics:

- Part-whole, part-to-part ratios, and rates
- Equivalent ratios
- Double number lines, ratio tables, and bar models
- The language of proportional reasoning

In Part 2, you will build on what you learned in Part 1, and study the following topics:

- Connections between ratios, fractions, percents, and decimals
- Making comparisons between ratios
- Solving proportions

In addition to the learning the topics above, you will find the following materials to help you:

- High School Equivalency Test Practice Questions. You will practice the concepts you have learned from this packet to work on these questions.
- A graphic organizer to study vocabulary is included, along with a vocabulary activity to review concepts. A glossary with important terms from this packet is also included for your study.
- Concept Circles can help you make connections between the concepts you have learned and help you remember those connections.

## Assessment Questions

## Calculator allowed

The following questions will help to see if this packet is right for you. Do your best to answer each question. If you can't answer, don't worry-this packet will help you answer questions like these and more. When you are finished with the questions, read our recommendations.

## Question 1

Tickets for a baseball game cost $\$ 60$ for a family of 5 . Adult and youth tickets cost the same amount. Based on this information, decide whether each statement is TRUE or FALSE.

|  | TRUE | FALSE |
| :--- | :--- | :--- |
| 2 tickets cost $\$ 24$. |  |  |
| For $\$ 40$, you can buy 4 tickets. |  |  |
| The cost is $\$ 12$ per ticket. |  |  |
| The cost for 10 tickets is $\$ 65$. |  |  |

## Question 2

It takes Mildred about 3 minutes to walk 2 blocks. A point has been plotted in the coordinate plane to represent this situation.
A. Plot a second point that represents an equivalent ratio.
B. Explain what the coordinates of the point you plotted represent.

## Question 3

Julia uses a photocopier to enlarge a business logo. The original dimensions of the logo were 2 " by 3 ". Which of the following could not be the dimensions of the enlargement?
A. $4 "$ by $6 "$
B. $4 "$ by $5 "$
C. $6 "$ by $9 "$
D. $8^{\prime \prime}$ by $12 "$

## Question 4

The price of Gina's dinner before tax and tip was $\$ 20.00$. The restaurant added $10 \%$ tax to the bill, then Gina left a $\$ 3.00$ tip. How much did Gina pay for her dinner in total?
A. $\$ 22.00$
B. $\$ 24.00$
C. $\$ 25.00$
D. $\$ 33.00$

## Answer Key

## Question 1.

|  | TRUE | FALSE |
| :--- | :---: | :---: |
| 2 tickets cost $\$ 24$. | x |  |
| For $\$ 40$, you can buy 4 tickets. |  | x |
| The cost is $\$ 12$ per ticket. | x |  |
| The cost for 10 tickets is $\$ 65$. |  | x |

## Question 2.

A. $(6,4)$ and $(9,6)$ should be the most common correct answers, but any points along the line would also be correct.
B. The student's explanation should show that they understand that the $x$ value represents the time that it takes Mildred to walk $y$ blocks. For example: It takes Mildred 6 minutes to walk 4 blocks.

## Question 3. B

Question 4. C

## Recommendations

Consider the following when making a decision about working through this packet:

- Student has some difficulty with Question 1 or 2: The student may choose to work through Proportional Reasoning, Part 1.
- Student has some difficulty with Question 3 and 4: If a student comfortably answers Questions $1 \& 2$, but has some difficulty with Questions 3 and 4, the student may feel confident enough to skip Proportional Reasoning, Part 1 and go directly to Proportional Reasoning, Part 2.
- Student comfortably answers all four questions: The student may choose to work on a different packet. However, it is recommended that students complete the Test Practice Questions in Proportional Reasoning, Part 2 for questions that require students to interpret a variety of proportional situations before they take the HSE exam.

This assessment asks students to demonstrate understanding of:
Question 1 (from Proportional Reasoning, Part 1): Compute unit rates, solve real-world problems using ratios or proportions (GED Quantitative Problem Solving Assessment Targets Content Indicator: Q.3.a, Q.3.c).

Question 2 (from Proportional Reasoning, Part 1 and 2): Compute unit rates, locate points in the coordinate plane, interpret unit rate as slope (GED Algebraic Problem Solving Assessment Targets Content Indicators: A.5.a, A.5.c, Q.3.a)

Question 2 (from Proportional Reasoning, Part 1): Compute unit rates, solve real-world problems using ratios or proportions (GED Quantitative Problem Solving Assessment Targets Content Indicator: Q.3.b).

Question 3 (from Proportional Reasoning, Part 1): Compute unit rates, solve real-world problems using ratios or proportions (GED Quantitative Problem Solving Assessment Targets Content Indicator: Q.3.d).

## Vocabulary

It is important to understand mathematical words when you are learning new topics. The following vocabulary will be used a lot in this study packet:

## convert, decimal, equivalent, proportion, quantity, rate, ratio, relationship

When we learn new vocabulary, it is good to think about your experience with the word. Asking questions like, "Have I heard this word before?", "When have I heard this word?", "What do I think this word means?" can help you build on what you already know.

Here's how it works. On the next page, you'll find a chart with each of the vocabulary words above. For each word, ask yourself how familiar you are with the word. For example, think about the word "area." Which of these statements is true for you and your experience with the word "area"?

- I know the word "area" and use it in conversation or writing.
- I know the word "area," but I don't use it.
- I have heard the word "area" but l'm not sure what it means.
- I have never heard the word "area" at all.

In the chart on the next page, read each word and then choose one of the four categories and mark your answer with a $\boldsymbol{V}$ (checkmark). Then write your best guess at the meaning of the word in the right column. If it's easier, you can also just use the word in a sentence.

Here's an example of how the row for "area" might look when you're done:

| Word | I know the <br> word and <br> use the word | I know the <br> word but <br> don't use it | have heard the <br> word, but Itm <br> not sure what <br> it means | I have never <br> heard the word | My best guess at the <br> meaning of the word <br> (or use the word in a sentence) |
| :--- | :---: | :---: | :---: | :---: | :---: |
| area | $\checkmark$ |  |  |  | A place or location, like a <br> neighborhood or town |

This activity is designed to help you start thinking about some of the important words you will find in this packet. As you go through the activities in this packet, you will learn more about these words, what they mean, and how to use them. You will learn more precise definitions that may come up during your high school equivalency exam.

There is a glossary with the definitions of useful vocabulary at the end of the packet.

|  | $\stackrel{\stackrel{\rightharpoonup}{0}}{\stackrel{\rightharpoonup}{0}}$ | $\stackrel{\underset{\sim}{\oplus}}{\stackrel{\rightharpoonup}{0}}$ |  | $\begin{aligned} & \text { 무 } \\ & \text { 응 } \\ & \text { 웅 } \end{aligned}$ |  | $\begin{aligned} & \text { 이 } \\ & \stackrel{\rightharpoonup}{3} \\ & \text { 응 } \end{aligned}$ |  | $\sum_{\text {인 }}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |

## Multiplication Warm-up

Understanding multiplication is important to understanding proportions and ratios, but it's okay if you don't have multiplication facts memorized. You can still learn all kinds of math!

1) Fill in the missing numbers in the multiplication table below.

| $\times$ | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 | 11 | 12 |
| :---: | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 | 11 | 12 |
| 2 |  | 4 |  | 8 |  | 12 |  | 16 |  | 20 |  | 24 |
| 3 | 3 |  | 9 |  | 15 |  | 21 |  | 27 |  | 33 |  |
| 4 |  | 8 |  | 16 |  | 24 |  | 32 |  | 40 |  | 48 |
| 5 | 5 |  | 15 |  | 25 |  | 35 |  | 45 |  | 55 |  |
| 6 |  |  |  | 24 |  |  |  | 48 |  |  |  | 72 |
| 7 |  |  |  |  |  |  |  |  |  |  |  |  |
| 8 |  | 16 |  |  |  | 48 |  |  |  | 80 |  |  |
| 9 |  |  |  |  |  |  |  |  |  |  |  |  |
| 10 |  |  |  | 40 |  |  |  | 80 |  |  |  | 120 |
| 11 |  |  | 33 |  |  |  |  |  | 99 |  |  |  |
| 12 |  | 24 |  | 48 |  | 72 |  | 96 |  | 120 |  | 144 |

2) What strategies did you use to find out the missing numbers?

Multiplication By Heart at Mathigon.com (https://mathigon.org/multiply) is a great way to practice multiplication.

## Multiplication Warm-up - Answer Key

1) 

| $\times$ | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 | 11 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| 1 | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 | 11 |
| 2 | 0 | 2 | 4 | 6 | 8 | 10 | 12 | 14 | 16 | 18 | 20 | 22 |
| 3 | 0 | 3 | 6 | 9 | 12 | 15 | 18 | 21 | 24 | 27 | 30 | 33 |
| 4 | 0 | 4 | 8 | 12 | 16 | 20 | 24 | 28 | 32 | 36 | 40 | 44 |
| 5 | 0 | 5 | 10 | 15 | 20 | 25 | 30 | 35 | 40 | 45 | 50 | 55 |
| 6 | 0 | 6 | 12 | 18 | 24 | 30 | 36 | 42 | 48 | 54 | 60 | 66 |
| 7 | 0 | 7 | 14 | 21 | 28 | 35 | 42 | 49 | 56 | 63 | 70 | 77 |
| 8 | 0 | 8 | 16 | 24 | 32 | 40 | 48 | 56 | 64 | 72 | 80 | 88 |
| 9 | 0 | 9 | 18 | 27 | 36 | 45 | 54 | 63 | 72 | 81 | 90 | 99 |
| 10 | 0 | 10 | 20 | 30 | 40 | 50 | 60 | 70 | 80 | 90 | 100 | 110 |
| 11 | 0 | 11 | 22 | 33 | 44 | 55 | 66 | 77 | 88 | 99 | 110 | 121 |

2) There are different strategies we can use to find the missing numbers. You might add the same number as you go down or across. Or you might see patterns in the numbers that help you fill in the table. Or you might have some of these multiplication facts memorized. You don't have to have them memorized, but it can be helpful.

## Introduction to Proportional Reasoning

A typical day is full of ratios and proportions.
Imagine waking up and pouring yourself a bowl of granola. One serving of granola is $1 / 4$ cup and has 150 calories. Some of us keep track of how many calories and nutrients we take in. If I have 1 cup of granola, how many calories am I consuming? How much sugar? How many grams of protein? The Nutrition Fact labels on our food are full of ratios and proportions that can help us keep track of the food we eat.

Maybe after breakfast, we take a shower. If your shower uses about two gallons of water per minute, how much water do you use in 10 minutes? If you take a 10-minute shower every day, how much water do you use in a week?

Ratios help us get where we are going. After getting dressed, some people drive to school or work. The speedometer measures your speed in a ratio (miles per hour). The price of gas is also a ratio. On the sign below, gas costs $\$ 3.43$ per gallon. This ratio is very important in household economics!

speedometer in a car

nutrients in our food

the price of gas

Some people ride a bike to work. If you ride a bike at a speed of 10 miles an hour for how far did you travel? We can use proportional reasoning to find out.

When resting, my heart rate is about 70 beats per minute. A friend wears a Fitbit in yoga classes so that he can look at his heart rate data after class. His heart rate went up to 150 beats per minute in a difficult class! There are many ratios related to fitness and health. Your heart rate is how many times your heart beats per minute. That is a ratio. You can count your
heart beats for 15 seconds or 30 seconds and still figure out how many times it beats in 1 minute.

After work, we might stop at a grocery store to buy food and ingredients for a cake. The price of produce is often shown as a ratio. According to this sign, you can buy 4 lemons for $\$ 2$.

Our recipe for sponge cake calls for eggs, sugar, flour, and lemons. The ingredients are all in proportion to each other. The

lemons for sale recipe below is for one cake. If we need to make three cakes, how much will we need of each ingredient?

```
45. Plain Sponge Cake.-The ideal proportions for a sponge cake are given in the accompanying recipe and upon these proportions the other recipes are based.
Plain Sponge Cake
\begin{tabular}{ll}
4 eggs & 1 c. flour \\
1 c. sugar & Juice and rind of \(\frac{1}{2}\) lemon
\end{tabular}
```

part of a recipe from a cookbook
Ratios and proportions are one of the most important types of math that we study in adult basic education, since we use this kind of thinking in our daily lives. When we think about rates, fractions, percents, and decimals, we are using proportional reasoning. We see ratios everywhere. Understanding them will make you more powerful using math. They are also an important part of the high school equivalency math exam.

In this packet, we will explore how to make sense of ratios and proportions in the world. We will practice thinking about ratios so that you do not have to memorize any tricks to solve proportions. All you have to do is use your good thinking brain. IYou will practice reasoning, which is the process of using logic to arrive at a conclusion. We will practice reasoning with ratios and proportions, using the information we have and applying it to different situations.

In Part 1 of this packet, you will practice creating different kinds of ratios. Then you will learn about making equivalent ratios. Making ratios that are equivalent to each other is an important part of thinking about proportions. You will use double number lines, ratio tables, and bar models to understand equivalent ratios. We will also learn what ratios look like on a graph.

In Part 2 of this packet, you will make connections between ratios, fractions, percents, and decimals and make comparisons between ratios. Then you will solve proportions using what you have learned about equivalent ratios.

## Sequences

A sequence is a list of things in order. Sometimes, a sequence can be a list of numbers, but it can also be a series of pictures.

The pictures below show the first three steps in a sequence. Look for a pattern, then draw steps 4 and 5.

Example:

1

2

3

4

5
3)

4
5

4)

2

3
4
4
5

2

3
4
3
4
5
7)

8)

4
5
9)

4

4
5

These are dollar bills (\$1.00).
11)

4

This is a nickel (\$0.05).

12) 1

3
4
13)

4
5

Write in the missing numbers on the number lines below.
14)

15)

16)

Complete these sequences by writing in the missing numbers.
17) $2,4,6$, $\qquad$
$\qquad$ , , _ـ_ $\qquad$
$\qquad$ $20,22, \ldots$
18) $\$ 0.75, \$ 1.50, \$ 2.25$, $\qquad$ , $\qquad$ , $\qquad$ , $\qquad$ , \$6.00, \$6.75, ...
19) $1.5,3,4.5$, $\qquad$ , ____ $\qquad$ , $\qquad$ $13.5,15, \ldots$

2O) $1 \frac{1}{4}, 2 \frac{2}{4}, 3 \frac{3}{4}$, $\qquad$ , ___ ___ $\qquad$ 10, $11 \frac{1}{4}, \ldots$
21) 24 is the second term in this sequence: $12,24,36, \ldots$ What is the sixth term in the sequence?
22) $\frac{3}{8}$ is the third term in this sequence: $\frac{1}{8}, \frac{2}{8}, \frac{3}{8}, \frac{4}{8} \ldots$

What is the ninth term in the sequence?

To play a game with more sequences, try What Comes Next? at https://bit.ly/whatcomesnextgame.

## Introducing Ratios

A ratio is a comparison between two or more numbers. It is a relationship between two quantities. Here are some examples of ratios that we might see in the world around us:

Shopping: 2 apples for 1 dollar
Nutrition: 140 calories for 2 cookies
Wages: \$16 per hour
Measurement: 12 inches per foot
Photography: 4 inches by 6 inches

Currency: 17.5 Mexican pesos for 1 U.S. dollar Speed: 60 miles per hour

Fuel efficiency: 30 miles per gallon
Health: 70 heartbeats per minute
Sports: 221 free throws out of 237 attempts

As you can see, ratios are used in many different situations. Each of the ratios above compare one thing to another.

In this section, we will practice using different ratios to describe situations. For example, look at this collection of shapes:

Here are a few ways we could describe the collection:

- For every 6 squares, there are 3 circles.
- The ratio of squares to circles is 6 to 3 , which can also be written as 6:3.
- The ratio of circles to squares is 3 to 6 , which can also be written as 3:6.

You might notice that the shapes are repeated in groups:

This allows us to compare the shapes in new ways:

- There are 2 squares for every 1 circle.
- There is 1 circle for every 2 squares.

Look at the collection of fruit and complete the sentences below.

23) The ratio of apples to bananas is $\qquad$ .
24) The ratio of oranges to apples is $\qquad$ .
25) For every $\qquad$ bananas, there are $\qquad$ oranges.

Below, each of the groups of shapes show the ratio of $3: 2$, and the whole set of groups together also shows the ratio of 3:2.

Complete the sentences below to write more ratios based on the collection of shapes above.
26) The ratio of triangles to circles is 12: $\qquad$ .
27) For every 12 $\qquad$ , there are 8 $\qquad$ .
28) For every 3 triangles, there are $\qquad$ circles.
29) There are $\qquad$ circles for every $\qquad$ triangles.

The ratio 3:2 could be used to describe the relationship between other things. For example, it could mean 3 cups of flour for every 2 cups of butter in a recipe for cookies, or a soccer team that wins 3 games for every 2 games it loses, or a ramp that goes over 3 feet for every 2 feet it goes up.

The ratio $3: 2$ means a relationship between any two quantities where there are 3 of one quantity for every 2 of the other quantity.

There are many ratios in cooking and baking. Here is an example of a ratio used when baking.
30) Emil is using a recipe to make 2 loaves of bread for his family. The recipe calls for 10 cups of flour and 6 cups of water.

Read the statements below and circle all that correctly describe this situation.
A. The ratio of cups of flour to cups of water is 5:3.
B. For every cup of water, there are 2 cups of flour.
C. There is 1 cup of flour for every 3 cups of water.
D. For every 10 cups of flour, there are 6 cups of water.
E. There are 3 cups of flour for every cup of water.
F. The ratio of water to flour is 3:5.
31) The recipe above makes 2 loaves of bread. How many cups of flour would Emil need if he wants to make 4 loaves of bread?
A. 4
B. 10
C. 12
D. 20
32) Draw the cups of flour and cups of water needed for 5 loaves of bread.

## Part-Whole and Part-to-Part Ratios

In humans, about 9 people out of every 10 people are right-handed. This is called a part-whole ratio, since part of the population (the number of right-handed people) is compared with the whole population (the total number of people).

Part-whole ratios are written as a fraction ( $\frac{9}{10}$ ) or with a colon (9:10).

$$
\frac{9 \text { right-handed people }}{10 \text { total people }}=9 \text { right-handed people out of every } 10 \text { people }=9: 10
$$

For every part-whole ratio, there is a different part-whole ratio that can be made with the other part. For example, if 9 out of every 10 people are right-handed, then 1 out of every 10 people is left-handed.

Note: A part-whole ratio is a fraction since it compares part of a quantity to the whole quantity. A part-whole ratio is a ratio and a fraction.
33) Which of the following shows the part-whole ratio of 1 left-handed person out of every 10 people? Select all that apply.
A. $\frac{1 \text { left-handed person }}{10 \text { total people }}$
B. $\frac{1 \text { left-handed person }}{9 \text { right-handed people }}$
C. 1 left-handed person:10 people
D. 1 left-handed person:9 right-handed people
34) If 20 people were randomly chosen and asked which of their hands is dominant, how many would you expect to be left-handed?
35) If 30 random people were asked, how many would you expect to be left-handed?

Imagine we flipped 20 pennies and laid out the results on the right.
With a part-whole ratio, we can compare the number of "heads" to the total number of flips:

11 heads out of 20 flips

11 heads:20 total flips
$\frac{11 \text { "heads" }}{20 \text { total flips }}$
36) Fill in the blanks. Each example shows the ratio of the number of "tails" to the total
 number of flips.

9 tails out of $\qquad$ total flips
$\qquad$ tails:20 total flips
$\frac{\text { tails }}{20 \text { total flips }}$
37) Which choice shows the part-whole ratio below?

Out of $20 \mathrm{M} \& \mathrm{Ms}, 3$ are yellow.
A. $\frac{3}{17}$
B. $\frac{3}{20}$
C. $\frac{17}{20}$
D. $\frac{17}{3}$
38) Which choices show the part-whole ratio below? Choose all that apply.

Out of $20 \mathrm{M} \& \mathrm{Ms}$, 4 are green.
A. 4 green: 20 total
B. 4 green: 16 total
C. 1 green: 5 total
D. 20 total: 4 green

If you want to compare the number of left-handed people to the number of right-handed people, you would use a part-to-part ratio. Here are two examples of part-to-part ratios:

For every 9 right-handed people, or For every 1 left-handed person, there is 1 left-handed person. there are 9 right-handed people.

A part-to-part ratio compares part of the population (left-handed people) to another part of the population (right-handed people). Part-to-part ratios are often written with a colon (9:1) but can also be written as a fraction $\left(\frac{9 \text { right-handed people }}{1 \text { left-handed person }}\right)$.

Note: Even though it can sometimes look like one, a part-to-part ratio is not a fraction. A fraction is a part-whole relationship. Comparing part of a quantity to another part of the quantity is a ratio, but is not a fraction.

Here are some ways to compare the number of left-handed people and the number of right-handed people:
$\frac{9 \text { right-handed people }}{1 \text { left-handed person }}=9$ right-handed people for every 1 left-handed person $=9: 1$
39) Which of the following shows the part-to-part ratio of 1 left-handed person for every 9 right-handed people? Select all that apply.
A. $\frac{1 \text { left-handed person }}{10 \text { total people }}$
B. $\frac{1 \text { left-handed person }}{9 \text { right-handed people }}$
C. 1 left-handed person:10 people
D. 1 left-handed person:9 right-handed people
40) In a survey of randomly chosen people, 5 of the people surveyed said they were left-handed. In the same survey, how many people would you expect to be right-handed?
41) If 36 people in a random survey were right-handed, how many would you expect to be left-handed?

Look at the results of our coin flip again. With a part-to-part ratio, we can compare the number of "heads" to the number of "tails."
42) How can we write this part-to-part ratio for coins? Choose all that apply.
A. $\frac{11 \text { "heads" }}{9 \text { "tails" }}$
B. $11: 9$
C. 9:11
D. $\frac{11 \text { "tails" }}{9 \text { "heads" }}$

43) Fill in the blanks to show three ways of comparing the number of "tails" to the number of "heads."

9 tails for every $\qquad$ heads
$\qquad$ tails: $\qquad$ heads
$\frac{\text { tails }}{11 \text { heads }}$
11 heads
44) Which choice shows the part-to-part ratio below? Choose all that apply. In a pack of $56 \mathrm{M} \& \mathrm{Ms}, 9$ are yellow and 11 are green.
A. $\frac{9}{11}$
B. $\frac{9}{7}$
C. $\frac{11}{20}$
D. $\frac{11}{9}$
45) Which choice shows the part-to-part ratio below? Choose all that apply. In a pack of $56 \mathrm{M} \& \mathrm{Ms}, 9$ are yellow and 11 are green.
A. 11 green: 9 yellow
B. 9 yellow: 11 green
C. 11 green: 20 total
D. 9 green: 20 total
46) Think about 10 friends, family members, or classmates. Write down their names.

In this group of 10 people...
...what is the ratio of left-handed people to total people?
...what is the ratio of right-handed people to total people?
...what is the ratio of left-handed people to right-handed people?
...what is the ratio of left-handed people to right-handed people?
47) For each of the following ratios, decide whether it is a part-to-part ratio (PTP) or a part-whole ratio (PW).

| Ratios | part-to-part <br> or <br> part-whole |
| :--- | :---: |
| 11 "heads" for every 9 "tails" | PTP |
| 11 "heads" out of 20 coin flips |  |
| Out of a class of 20 students, 12 students speak more than one language |  |
| 12 bilingual students for every 8 students who speak only one language |  |
| 4 blue M\&Ms for every 3 yellow M\&Ms |  |
| 42 correct answers for every 8 incorrect answers |  |
| 42 correct answers out of 50 answers on a test |  |
| Out of 20 M\&Ms, 3 are yellow |  |
| 5 M\&Ms are brown and 4 M\&Ms are green |  |

Practice your ratio skills with the situation below.
Polly bought a bag of Polygon Pieces and emptied the candies onto a table. They were in the form of triangles $(t)$, squares ( $s$ ), pentagons ( $p$ ), and hexagons ( $h$ ).

48) Mark the following statements true or false.

| Statements | T or F |
| :--- | :---: |
| There are 2 triangles for every 1 square. | T |
| The ratio of pentagons to triangles is 7:6. |  |
| The ratio of hexagons to total candies is $\frac{4}{16}$. |  |
| There are 7 pentagons out of 20 total pieces of candy. |  |
| For every 2 hexagons, there are 3 triangles. |  |
| The ratio of squares to total candies is $3: 17$. |  |
| The ratio of triangles to total candies is $\frac{3}{10}$. |  |

49) Write your own true statement using ratios from Polygon Pieces diagram above.
50) Look at the image below and put a checkmark next to each true statement.

There are 6 spoons for every 8 forks.
$\square$ The ratio of spoons to forks is 3:4.
The ratio of forks to spoons is 8:6.
There are 3 spoons for every 4 forks.
51) The ratio 3 spoons: 4 forks is a...
A. part-to-part ratio
B. part-whole ratio
52) The ratio $\frac{6 \text { spoons }}{14 \text { utensils }}$ is a...
A. part-to-part ratio
B. part-whole ratio
$\square$ There are 6 spoons for every 14 utensils.
$\square$ There are 8 forks for every 14 utensils.The ratio of forks to utensils is 8:14.
$\square$ The ratio of spoons to utensils is 6:14.
53) The ratio 5 apples: 15 pieces of fruits is a...
A. part-to-part ratio
B. part-whole ratio
54) The ratio $\frac{3 \text { bananas }}{2 \text { oranges }}$ is a...
A. part-to-part ratio
B. part-whole ratio
55) There are 16 students total in an adult education class. 12 of these students live in the Bronx. The remaining students live in Manhattan.

Write as many ratios as you can about the students in this class.

## Rates

A rate is a ratio that shows the relationship between different kinds of quantities. To see the cost of bananas, we might look at the relationship between pounds and dollars. A price of $\$ 0.50$ per pound is an example of a rate which compares dollars and pounds.

Here are some other examples of rates:

| $\$ 16$ per hour | 80 heartbeats per minute | sales tax rate of 8.875 percent |
| :--- | :--- | :--- |
| 50 miles per hour | 10,000 steps per day | 100 megabits per second (Mbps) |

We often use the word per when we are working with rates. The word per means "for each" or "for every." So, being paid "\$16 per hour" means 16 dollars for each hour of work.
56) What two quantities are compared in the rate shown on this sign?
A. number of apples and pounds
B. number of apples and dollars
C. quarters and dollars
D. pounds and dollars

57) What two quantities are compared in the rate shown on this gauge?
A. miles and gallons of gas
B. gallons of gas and hours
C. miles and hours
D. minutes and hours

58) What two quantities are compared in the rate shown on this sign?
A. miles and gallons of gas
B. dollars and gallons of gas
C. gallons of gas and hours
D. miles and hours

Look at the price of oranges shown on the right. This rate shows the relationship between the number of oranges and the price in dollars.

We could use a drawing to show that 4 oranges costs $\$ 2$ :

59) How much would 8 oranges cost?

60) Make a drawing below to show the cost of 12 oranges.

We can also use a double number line to see the prices of different quantities of oranges. This is an example of a double number line:
oranges

dollars
It is called a double number line because it shows two different quantities at the same time. The top of the number line shows numbers of oranges. The bottom of the number line shows the price.
61) What do you notice when you look at the oranges and dollars number line?

The following information is from the New York State Department of Labor.

| Long Island and <br> Westchester County |
| :---: |
| Minimum Wage <br> Overtime after 40 hours$\$ 16.00$ |
| $\$ 24.00$ |

| Remainder of <br> New York State |
| :---: |
| Minimum Wage <br> Overtime after 40 hours |
| $\mathbf{\$ 1 5 . 0 0}$ |
| $\$ 22.50$ |

If you have questions, need more information or want to file a complaint, please visit www.labor.ny.gov/minimumwage or call: 1-888-469-7365.
62) What two quantities are compared in the rates shown in this image?
A. hours of work and number of employees
C. large employers and small employers
B. dollars and cents
D. dollars and hours of work
63) Write in the missing dollar amounts on the number line.
hours of work

These quantities can be written as ratios: $\frac{\$ 16}{1 \text { hour }}, \frac{\$ 32}{2 \text { hours }}$, and $\frac{\$ 48}{4 \text { hours }}$. Each of these ratios are equivalent, meaning they have the same value. Though they show different numbers of hours and amounts of money, they all follow the same hourly pay rate: 16 dollars for each hour of work.
64) Which of the following ratios is not equivalent to $\$ 16 / h o u r$ ?
A. 32 dollars:2 hours
B. 45 dollars:3 hours
C. 80 dollars: 5 hours
D. 160 dollars: 10 hours

2O) $1 \frac{1}{4}, 2 \frac{2}{4}, 3 \frac{3}{4}, 5,6 \frac{1}{4}, 7 \frac{2}{4}, 8 \frac{3}{4}, 10,11 \frac{1}{4}, \ldots$
21) 72
22) $\frac{9}{8}$ or $1 \frac{1}{8}$

## Introducing Ratios

23) $5: 6$
24) $4: 5$
25) There are two right answers:

For every 6 bananas, there are 4 oranges.
For every 3 bananas, there are 2 oranges.
26) 8
27) triangles, circles
28) 2
29) There are a few right answers:

There are 8 circles for every 12 triangles.
There are 4 circles for every 6 triangles.
There are 2 circles for every 3 triangles.
30) A, D, F
31) D
32) Your drawing should show 25 cups of flour and 15 cups of water.

## Part-Whole and Part-to-Part Ratios

33) A, C
34) 2
35) 3
36) 9 tails out of 20 total flips

9 tails:20 total flips
$\frac{9 \text { tails }}{20 \text { total flips }}$
37) $B$
38) A, C, D
39) B, D
40) 45
41) 4
42) All are correct ways of writing the part-to-part ratio
43) 9 tails for every 11 heads

9 tails:11 heads
$\frac{9 \text { tails }}{11 \text { heads }}$
44) $A, D$
45) $\mathrm{A}, \mathrm{B}$
46) Answers will vary.
47)

| Ratios | part-to-part <br> or <br> part-whole |
| :--- | :---: |
| 11 "heads" for every 9 "tails" | PTP |
| 11 "heads" out of 20 coin flips | PW |
| Out of a class of 20 students, 12 students speak more than one language | PW |
| 12 bilingual students for every 8 students who speak only one language | PTP |
| 4 blue M\&Ms for every 3 yellow M\&Ms | PTP |
| 42 correct answers for every 8 incorrect answers | PTP |
| 42 correct answers out of 50 answers on a test | PTW |
| Out of 20 M\&Ms, 3 are yellow | PTW |
| 5 M\&Ms are brown and 4 M\&Ms are green | PTP |

48) 

| Statements | T or F |
| :--- | :---: |
| There are 2 triangles for every 1 square. | T |
| The ratio of pentagons to triangles is $7: 6$. | T |
| The ratio of hexagons to total candies is $\frac{4}{16}$. | F |
| There are 7 pentagons out of 20 total pieces of candy. | T |
| For every 2 hexagons, there are 3 triangles. | T |
| The ratio of squares to total candies is $3: 17$. | F |
| The ratio of triangles to total candies is $\frac{3}{10}$. | T |

49) Answers will vary.
50) All of these statements are true.
51) A
52) $B$
53) B
54) A
55) Answers will vary.

## Rates

56) $D$
57) C
58) B
59) \$4
60) You should have six dollar bills in your drawing.
61) There are many things you might notice. A couple things we noticed: The numbers on the top go up by 4 and the numbers on the bottom go up by 2 .

## Proportional Reasoning (Part 1)

## There are some missing numbers.

Each number on top is twice as much as the number below.
62) $D$
63)
hours of work

dollars
64) B

## Equivalent Ratios: Making Copies and Splitting Evenly

Equivalent ratios are ratios that have the same value, even though they may look different. For example, consider the following equivalent ratios:

- A wage of $\$ 16$ per hour
- A wage of $\$ 32$ for two hours of work
- A wage of $\$ 64$ for four hours of work
$\$ 16$ is not equivalent to $\$ 64$, but a ratio of $\$ 16$ for 1 hour of work is an equivalent ratio to $\$ 64$ for 4 hours of work.

Equivalent ratios are helpful for solving all kinds of problems and can help us with math in our daily life.

One way to create equivalent ratios is to make copies of the original ratio. For example, the image below shows three copies of the ratio, 4 oranges for $\$ 2.00$.

The new ratio of 12 oranges for $\$ 6.00$ is equivalent to 4 oranges for $\$ 2.00$.
A double number line helps us make more ratios that are equivalent to the original price. It is very similar to a regular number line. ${ }^{1}$ Quantities (numbers) get bigger as you move to the right and smaller as you move to the left.

dollars

[^0]A ratio table is another way to make equivalent ratios. Do you see how 4 oranges and 2 dollars are added for each new column?

| oranges | 4 | 8 | 12 | 16 | 20 | 24 | 28 | 32 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| dollars | 2 | 4 | 6 | 8 | 10 | 12 | 14 | 16 |

Each of these tools can show that $\frac{4 \text { oranges }}{2 \text { dollars }}$ is equivalent to $\frac{12 \text { oranges }}{6 \text { dollars }}$.
In this section, we will use drawings, double number lines, and ratio tables to practice making equivalent ratios.

## Measurement Ratios with a Double Number Line

For each double number line below, fill in the missing numbers, then answer the questions.

1) Ounces and pounds are measurements of weight. There are 16 ounces in 1 pound.
pounds

2) How many ounces are in 14 pounds?
3) Which of these statements are true? Choose all that are true.
A. There are 16 ounces for every pound.
B. There are 16 pounds for every ounce.
C. There are 64 ounces for every 4 pounds.
D. There are 5 pounds for every 80 ounces.
4) Grams and kilograms are measurements of weight. There are 1000 grams in 1 kilogram. kilograms

5) How many grams are in $5 \frac{1}{2}$ kilograms?
6) Kilograms are part of the metric system of measurement and pounds are part of the U.S. system of measurement. We can use ratios to convert (change) from one to the other. There are approximately 2.2 pounds in 1 kilogram.
kilograms

7) Which of these ratios are correct? Select all that are true.
A. $\frac{1 \text { kilogram }}{2.2 \text { pounds }}$
B. $\frac{1 \text { pound }}{2.2 \text { kilograms }}$
C. $\frac{4 \text { kilograms }}{8.8 \text { pounds }}$
D. $\frac{5 \text { kilograms }}{5.5 \text { pounds }}$
8) How many pounds would be equal to 5 kilograms?
9) Feet and inches are measurements of length used in the United States. There are 12 inches in 1 foot. (These are not drawn to size.)
feet

10) Which of these ratios are correct? Select all that are true.
A. 1 foot:12 inches
B. 24 inches: 2 feet
C. 36 feet: 3 inches
D. 5 feet: 60 inches
11) If someone is 6 feet tall, how tall are they if you measure in inches?
12) Meters and centimeters are measurements of length used in most countries.
meters

13) 350 centimeters is equal to how many meters?
14) Centimeters are part of the metric system of measurement and inches are part of the U.S. system of measurement, but we can use ratios to convert them. 1 inch equals approximately 2.54 centimeters.
inches

15) 8 inches is equal to how many centimeters?
16) Gallons and quarts are measurements of volume. We often use them to measure liquids such as milk.
gallons

17) How many quarts are in 5 gallons?
A. $1 \frac{1}{4}$
B. 20
C. 24
D. 100
18) The following diagram is used to remember the relationships between gallons (G), quarts $(Q)$, pints (P), and cups (C), which are all measurements of volume.

Some ratios in the diagram:

- 4 quarts in 1 gallon ( 4 Qs in 1G)
- 2 pints in 1 quart ( 2 Ps in 1Q)
- 2 cups in 1 pint (2Cs in 1 P )

What other ratios do you see in this diagram?
Write as many as you can below.

## Making Equivalent Ratios with Ratio Tables

Baking requires attention to detail. It is important to measure carefully and use the correct amounts of ingredients.
Understanding ratios can help you become an expert baker.

When making bread, many bakers use the following ratio: three cups of water and five cups of flour to make one loaf of bread.

Imagine that you own a bakery. Since you sell a lot of bread, you have to increase the amounts in the recipe so that you can make more than one loaf of bread at a time.
19) Your bakers use the ratio table below to calculate your quantities of flour and water. Unfortunately, one of the bakers spilled coffee on the paper. Can you replace the missing numbers?

| cups of water | $\mathbf{3}$ | $\mathbf{6}$ | $\mathbf{9}$ | 12 |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| cups of flour | $\mathbf{5}$ | 10 | 15 |  |  |  |
| loaves of bread | $\mathbf{1}$ | 2 |  |  |  |  |

20) How many loaves of bread can you make with 10 cups of flour?
21) How much flour do you need for 12 cups of water?
22) How much water do you need for 30 cups of flour?
23) One of your regular customer calls with a special order for 10 loaves of bread. Complete the table below to show how much water and flour you will need.

| cups of water | 3 |  |
| :---: | :---: | :---: |
| cups of flour | 5 |  |
| loaves of bread | 1 | 10 |

As we increase the amount of bread we make for the bakery, we can use ratio tables to make sure that we follow the original ratio of 3 cups of water for every 5 cups of flour. All of the ratios in our table are equivalent to the original ratio of $3: 5$. We create equivalent ratios by multiplying the amount of each ingredient by the same number.

Here is the flour and water ratio table again, starting with the ratio $\frac{3 \text { cups of water }}{5 \text { cups of flour }}$.

Both parts of the ratio $\frac{3}{5}$ can be multiplied by 10 to make ten loaves of bread.

$$
\frac{3 \times 10}{5 \times 10}=\frac{30}{50}
$$

If both parts of a ratio are multiplied by the same number, the new ratio is equivalent to the original ratio. The equivalent ratios of $\frac{6 \text { cups of water }}{10 \text { cups of flour }}$ and $\frac{30 \text { cups of water }}{50 \text { cups of flour }}$ were created with the ratio table.
24) Which of the following ratios would follow the $3: 5$ bread recipe for 20 loaves of bread?
A. 23 cups of water and 25 cups of flour
B. 30 cups of water and 50 cups of flour
C. 60 cups of water and 90 cups of flour
D. 60 cups of water and 100 cups of flour
25) If you charge $\$ 4.00$ per loaf of bread, how much money would you make after you sell bread made from 20 cups of flour? Explain your answer below.
26) Which of the following ratios does not follow the $3: 5$ bread recipe?
A. 6 cups of water and 10 cups of flour
B. 12 cups of water and 20 cups of flour
C. 15 cups of water and 30 cups of flour
D. 21 cups of water and 35 cups of flour

A cookie recipe calls for three cups of flour for every one cup of sugar. Use this ratio of 3:1 to guide your reasoning below.
27) Complete the table below by determining which of the recipes are correct. Then predict how the cookies will turn out. (TOO SWEET, NOT SWEET ENOUGH, or PERFECT)

| Cups of Flour | Cups of Sugar | Does the recipe follow the correct ratio? <br> YES or NO | How will the cookies taste? |
| :---: | :---: | :---: | :---: |
| 3 | 1 | Yes | Perfect |
| 4 | 2 |  |  |
| 4.5 | 1.5 |  |  |
| 6 | 2 |  |  |
| 7 | 2 |  |  |
| 8 | 4 |  |  |
| 10 | 3 |  |  |
| 12 | 4 |  |  |
| 13 | 6 |  |  |
| 15 | 5 |  |  |

28) Now graph all the points from the previous page. The first recipe has been placed on the chart.

29) Look at the graph after you draw all the points. What do you notice?

## Rates: Making Copies with Ratio Tables

Ratio tables allow us to add, subtract, multiply, and divide to make equivalent ratios.
Complete the following tables to make different equivalent ratios.
30) A store is selling 4 apples for $\$ 3.00$. Fill in the blanks in the ratio table below.

Hint: Try adding columns or multiplying columns by the same number.
31) After driving for 2 hours, you have traveled 100 miles.

| hours | 2 | 6 | 8 |  | 9 |  |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: |
| miles | 100 |  |  | 50 |  | 250 |

32) Currency exchange rates allow people to trade money from one country for money from another country. In December 2023, you could get about 11 U.S. dollars for 10 Euros.

| Euros | 10 | 20 | 40 |  | 90 | 100 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: |
| U.S. dollars | 11 |  |  | 55 |  |  |

33) If you can get 11 U.S. dollars for 10 Euros, how many U.S. dollars could you get for 30 Euros?
34) In basketball, you get one point when you successfully shoot a free throw into the net. Stephen Curry from the Golden State Warriors is currently the best free throw shooter in the NBA. He completes about 90 out of every 100 free throws.

| free throws <br> completed | 90 |  |  |  |  | 270 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: |
| free throws <br> attempted | 100 | 200 | 400 | 50 | 450 |  |

35) The U.S. Department of Health and Human Services recommends that Americans eat at least $21 / 2$ cups of vegetables per day.

| cups of vegetables | $2 \frac{1}{2}$ |  |  |  |  | 40 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: |
| days | 1 | 2 | 4 | 5 | 8 |  |

36) A nurse measures a patients' heart rate as 20 heartbeats in 15 seconds.

| Seconds | 15 | 30 | 60 | 75 |  | 120 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: |
| Heartbeats | 20 |  |  |  | 120 |  |

37) Spotify pays music artists about $\$ 0.003$ per stream ${ }^{2}$.

| Streams | 1 | 2 | 10 | 20 | 100 | 200 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: |
| Dollars | $\$ 0.003$ | $\$ 0.006$ |  |  |  |  |

Use the ratio table to find the amount of money for larger numbers of streams.

| Streams |  |  |  |  |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Dollars |  |  |  |  |  |  |

[^1]
## Equivalent Fractions

The top number in a fraction is called the numerator. It is the value of the "part." The bottom number in a fraction is called the denominator. It is the value

## numerator (part)

 denominator $\longrightarrow 10$ all people (whole) of the "whole" or the number of parts the whole is divided into.When you multiply or divide the numerator and denominator by the same number, the value of the fraction doesn't change. The new fraction will be equivalent to the original fraction. In the example below, $\frac{2}{20}$ is equivalent to $\frac{1}{10}$.
38) Fill in the missing values in the ratio table.

39) Which of these equations is not true?
A. $\frac{1}{10}=\frac{2}{20}$
B. $\frac{10}{100}=\frac{5}{50}$
C. $\frac{2}{20}=\frac{15}{150}$
D. $\frac{1}{10}=\frac{10}{20}$

Multiply the top number and bottom number by any number to create equivalent fractions. Make sure you multiply the top and bottom number by the same number.
40) Create five equivalent fractions for $\frac{3}{4}$. (One has been done for you.)

| 3 | 6 |  |  |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- |
| 4 | 8 |  |  |  |  |

41) Create five equivalent fractions for $\frac{7}{10}$.

| 7 |  |  |  |  |  |
| :---: | :--- | :--- | :--- | :--- | :--- | :--- |
| 10 |  |  |  |  |  |

42) Multiply or divide the numerator and denominator by any number to create five equivalent fractions for $\frac{1}{2}$.

43) Create five equivalent fractions for $\frac{15}{6}$.

44) Which of the following ratios is not equivalent to $\frac{1}{4}$ ?
A. $\frac{4}{16}$
B. $\frac{6}{24}$
C. $\frac{7}{35}$
D. $\frac{9}{36}$

How do you know?
45) Fill in the missing parts of the fractions to create equivalent ratios.

46) Which ratio is equivalent to $\frac{2}{10}$ and the other fractions above?
A. 1:10
C. $2: 5$
B. $1: 5$
D. $5: 10$
47) Using the digits 0 to 9 at most one time each, place a digit in each box so that you have two equivalent ratios.

Here is one solution: $\frac{3}{1}=\frac{24}{8}$
How many solutions can you find?

This is based on an activity from openmiddle.com, where similar challenges can be found.

## Splitting Ratios Evenly

So far, we have used addition and multiplication to create equivalent ratios. We can also use division to create equivalent ratios. In this section, we will create equivalent ratios by splitting the original ratio into equal pieces. To see how this works, we will use double number lines to represent ratios.
48) Try the following task:

A nurse measures a heart rate of 90 heartbeats in 60 seconds. Use the number line below to show how many heartbeats there would be in 20 seconds.
seconds

We can use the strategy of splitting evenly to find 20 seconds on this number line. The first step is to measure the distance between O and 60.

We can ask ourselves, "How many pieces 20 seconds long will fit in a distance of 60 seconds?" If we split 60 into three equal pieces, each piece will be 20 seconds long.

How many heartbeats happen in each 20 seconds?

To find the number of heartbeats in 20 seconds, we need to cut 90 seconds into three equal pieces as well.

We can see that 30 heartbeats would happen in 20 seconds. The ratio $\frac{30 \text { heartbeats }}{20 \text { seconds }}$ is equivalent to $\frac{90 \text { heartbeats }}{60 \text { seconds }}$. Our final answer might look like the number line below.

heartbeats

Use the number lines below to split the ratios evenly to find new equivalent ratios.
49) A nurse measures a heart rate of 100 heartbeats in 60 seconds. Use the number line below to show how many heartbeats there would be in 15 seconds.

50) Which of these ratios is equivalent to 100 heartbeats/ 60 seconds?
A. 50 heartbeats $/ 20$ seconds
B. 20 heartbeats $/ 15$ seconds
C. 30 heartbeats/20 seconds
D. 200 heartbeats $/ 120$ seconds
51) A computer printer prints 240 pages in 12 minutes. Use the number line below to show how many pages it would print in 4 minutes.

52) In December 2023, you could get about 60 Dominican pesos for 1 U.S. dollar (100 pennies). Use the number line to show how many pesos you could get for 20 U.S. cents.

Dominican pesos

53) We can use your work on the number line above to answer different questions. For example, how many Dominican pesos would you get for 40 U.S. cents?
54) A grocery store sells 8 tangerines for $\$ 3.00$. Use the number line below to show the price of 2 tangerines.
tangerines

55) How much would 6 tangerines cost?
56) A power company charges $\$ 75$ for 200 kilowatt-hours of electricity. Use the number line below to show the cost of 40 kilowatt-hours of electricity.

57) Every 30 days, a family pays $\$ 2000$ rent for a 1-bedroom apartment. Use the number line below to show the amount of rent for 6 days.
days

dollars
58) In December 2023, you could get about 160 Jamaican dollars for 1 U.S. dollar. Use the number line to show how many Jamaican dollars you could get for 25 U.S. cents.

Jamaican dollars

U.S. dollars
59) There are 16 cups in 1 gallon. How many cups are in $\frac{1}{8}$ of a gallon? Add labels and missing numbers to the number line below.

60) At a grocery store, cheddar cheese costs $\$ 6.00$ per pound. How much would $\frac{1}{4}$ of a pound cost?

61) How much would $\frac{3}{4}$ of a pound of cheddar cheese cost?
62) A Mitsubishi Mirage can travel about 400 miles with 10 gallons of gasoline. Add labels and missing numbers to the number line to show how many miles you could drive with 2 gallons of gasoline.

We can also use ratio tables to split ratios into equivalent ratios with smaller quantities.
63) Try the following task:

A nurse measures a heart rate of 90 heartbeats in 60 seconds. Use the ratio table below to show how many heartbeats there would be in 2 seconds. (You don't have to use all of the columns in the table.)

| heartbeats | 90 |  |  |  |  |
| :--- | :---: | :--- | :--- | :--- | :--- |
| seconds | 60 |  |  |  |  |

A heart rate of 90 heartbeats in 60 seconds is equivalent to 3 heartbeats in 2 seconds. There are different ways to show the two ratios are equivalent. Here is one way:

Each of these ratios ( $\frac{90}{60}, \frac{45}{30}, \frac{9}{6}$, and $\frac{3}{2}$ ) are equivalent. If you multiply or divide each number in a ratio, the value of the ratio doesn't change.
64) Show a different way to change $\frac{90}{60}$ to $\frac{3}{2}$.
65) There are 960 calories in 12 slices of a brand of cheddar cheese. Show how many calories are in 3 slices.

| slices | 12 |  |  |  |  |
| :--- | :---: | :--- | :--- | :--- | :--- |
| calories | 960 |  |  |  |  |

66) A worker makes $\$ 1000$ in 40 hours. Show how many hours they work to make $\$ 200$.

| hours |  |  |  |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- |
| dollars |  |  |  |  |  |

67) A grocery store charges $\$ 5.00$ for a gallon of milk. At this price, how much money would 2 quarts cost? (Hint: There are four quarts in a gallon.)

| quarts |  |  |  |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- |
| dollars |  |  |  |  |  |

68) At the same price above, how much would 3 quarts cost?
69) In a 5-minute shower, 10 gallons of water flows down the drain. How much water would a 2-minute shower use?

|  |  |  |  |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- |
|  |  |  |  |  |  |

70) New York City charges about $1 \frac{1}{2}$ cents per gallon for water usage. How much money does a 15-minute shower cost in NYC? Explain your thinking below.
71) A grocery store charges $\$ 6.00$ for 5 apples. At this price, how much money would 1 apple cost?

72) At the same price above, how much would 4 apples cost?

## Unit Rates

Unit rates answer the question, "How much (or how many) for one?" The unit rate of 25 miles per gallon means a car can travel 25 miles on 1 gallon of gas. In a unit rate, one of the quantities in the ratio is 1 . The ratio shows how much of something per 1 unit of something else.
73) If a car travels 25 miles with 1 gallon of gas, how far would it travel with 3 gallons?

| miles | 25 |  |
| :--- | :---: | :---: |
| gallons | 1 | 3 |

The unit price is the cost for one item or for one unit of measure. The price per pound is a common unit price in the United States. Unit price is a kind of unit rate.
74) If 1 pound of apples costs $\$ 3.00$, how much would 5 pounds of apples cost?

| pounds | 1 |  |
| :--- | :---: | :--- |
| dollars | 3.00 |  |

You can make a unit rate from other kinds of rates. For example, if you were told oranges cost $\$ 2$ for 4 oranges, you could figure out that the unit rate is $\$ 0.50$ for 1 orange, which can be written as $\$ 0.50 /$ orange. This answers the question, "How much money for 1 orange?"

Figure out the unit rate in the examples below.
75) If 4 pounds of broccoli cost $\$ 10.00$, how much would 1 pound cost?

76) If 10 feet of chain link fencing cost $\$ 150.00$, what is the unit price per foot?

| feet |  |  |
| :--- | :--- | :--- |
| dollars |  |  |

The unit price can be used to find the price of different quantities, even if the unit price isn't given. You can find the unit price, then find the cost of different quantities.

## Question:

If 4 pounds of broccoli costs $\$ 10.00$, how much would 5 pounds cost?

Answer:
Unit price: 1 pound for $\$ 2.50$
Price for 5 pounds: $\$ 12.50$

77) If 5 bananas cost $\$ 1.00$, how much would 3 bananas cost?

| bananas |  |  |  |
| :--- | :--- | :--- | :--- |
| dollars |  |  |  |

78) If 6 pieces of candy cost $\$ 1.50$, how much would 7 pieces of candy cost?

79) If you earn 150 dollars in 5 hours, how much money would you make in 12 hours?

There are always two different unit rates when comparing two quantities. For example, look at the following price:

## Chocolate chip cookies

8 cookies for $\$ 2.00$

In the price, two quantities are being compared: the number of cookies and the number of dollars. There are two possible unit rates:

The price in dollars of 1 cookie

80) What is the price of 1 cookie?

81) How many cookies for 1 dollar?
82) Buying 2 pounds of tomatoes for $\$ 3.00$ :

How much does 1 pound cost?
How many pounds do you get for 1 dollar?
83) Walking 20 miles in 5 hours:

How many miles in 1 hour?
How many hours to walk 1 mile?
84) Angela can run 10 laps in 30 minutes.
a. How many minutes does it take Angela to run one lap?
b. How many laps does she run per minute?

| laps | 10 | 1 |  |
| :--- | :---: | :---: | :---: |
| minutes | 30 |  | 1 |

85) Lin rode a bike 20 miles in 120 minutes. Assuming they rode at a constant speed...
a. How fast did Lin ride in miles per hour?
b. How long did it take Lin to ride 5 miles?
c. How far did Lin ride in 15 minutes?
d. How fast did Lin ride in minutes per mile?

| miles | 20 |  |  |  |  |
| :--- | :---: | :--- | :--- | :--- | :--- |
| minutes | 120 |  |  |  |  |
| hours |  |  |  |  |  |

86) Using the digits $O$ to 9 at most one time each, place a digit in each box to make two equivalent ratios where one of the ratios is a unit rate.

Here is one solution: $\frac{45}{90}=\frac{1}{2}$.
How many solutions can you find?

This is based on an activity from openmiddle.com, where similar challenges can be found.

## Is It Proportional?

A proportion is a statement that two ratios or fractions are equivalent. Each of the examples below are proportions:

$$
\frac{12 \text { inches }}{1 \text { foot }}=\frac{36 \text { inches }}{3 \text { feet }} \quad 2: 3=10: 15 \quad \frac{100 \text { dollars }}{92 \text { Euros }}=\frac{25 \text { dollars }}{23 \text { Euros }}
$$

$\$ 16$ pay for 1 hour or $\$ 32$ pay for 2 hours
If 8 oranges cost $\$ 2.00$, then 2 oranges would cost $\$ 0.50$.

1 inch

1.5 inches

3 inches

If one ratio is equivalent to another ratio, they are proportional to each other.
87) For each of the following, decide whether the two ratios are proportional to each other. Place a checkmark $\checkmark$ next to the ratios that are in proportion to each other.
$\square 1$ pound of celery for $\$ 1.50 \& 4$ pounds for $\$ 6.00$
$\square$ A batch of cookies with 3 cups of flour and 1 cup of sugar \& a batch of cookies with 2 cups of flour and $\frac{1}{2}$ cup of sugar
$\square$ rent of $\$ 2000 /$ month for 500 square feet $\& \$ 3000 /$ month for 750 square feet
$\square 20$ heartbeats in 15 seconds \& 60 heartbeats in 60 seconds
$\$ 75$ for 210 kilowatt-hours of electricity and $\$ 15$ for 42 kilowatt-hours

Solve each of the following problems.
88) Theo and Emil are brothers who were born exactly three years apart. When Theo was 2 years old, Emil was 5. When Theo was 6, how old was Emil?
89) Emil and Theo are saving money to buy soccer jerseys. They decide that they will each put their full allowance of $\$ 5.00$ per week into their savings. When they start saving money, Emil already has $\$ 20.00$ saved and Theo has $\$ 10.00$. How much does Theo have when Emil has $\$ 60.00$ ?
90) Dan and Lawrence are baking bread using the same recipe. Dan is making a loaf of bread using 5 cups of flour and 3 cups of water. Since he is making more bread, Lawrence uses 15 cups of flour. How many cups of water does Lawrence need?
91) Andrea and Casey are each planting peas in their gardens. Andrea plants 2 rows and Casey plants 4 rows. If Andrea's peas are ready to pick in 8 weeks, how long will it take for Casey's peas to be ready?
92) Only one of the four situations above is proportional. Circle the proportional situation.

| dollars | 1.50 | 0.25 | 1.75 |

79) 

| hours | 5 | 1 | 12 |
| :--- | :---: | :---: | :---: |
| dollars | 150 | 30 | 360 |

80) $\$ 0.25$ for 1 cookie
81) 4 cookies for 1 dollar
82) 1 pound for $\$ 1.50$
$\frac{2}{3}$ pounds for 1 dollar
83) 4 miles in 1 hour

1 mile in $\frac{1}{4}$ hour
84) a. 3 minutes for 1 lap
b. $\frac{1}{3}$ lap per minute

| laps | 10 | 1 | $\frac{1}{3}$ |
| :--- | :---: | :---: | :---: |
| minutes | 30 | 3 | 1 |

85) a. 10 miles per hour ( 10 miles in 1 hour)
b. 30 minutes
c. 2.5 miles
d. 6 minutes per mile ( 1 mile in 6 minutes)

This is one way to use the ratio table. You may do it in a different way.

| miles | 20 | 10 | 5 | 2.5 | 1 |
| :--- | :---: | :---: | :---: | :---: | :---: |
| minutes | 120 | 60 | 30 | 15 | 6 |
| hours | 2 | 1 | $\frac{1}{2}$ | $\frac{1}{4}$ | $\frac{1}{10}$ |

86) There are many correct answers. Here are a few more correct answers:
$\frac{15}{20}=\frac{3}{4}, \frac{96}{48}=\frac{2}{1}, \frac{34}{68}=\frac{1}{2}, \frac{72}{96}=\frac{3}{4}$, and more....

## Is It Proportional?

87) 1 pound of celery for $\$ 1.50 \& 4$ pounds for $\$ 6.00$ rent of $\$ 2000 /$ month for 500 square feet \& $\$ 3000 /$ month for 750 square feet $\$ 75$ for 210 kilowatt-hours of electricity and $\$ 15$ for 42 kilowatt-hours
88) 9 years old

## Proportional Reasoning (Part 1)

89) $\$ 50.00$
90) 9 cups
91) 8 weeks (It doesn't take twice as long for twice as many plants to grow. It takes the same amount of time.)
92) The bread baking situation is proportional. The other three situations are not proportional.

## The Language of Proportional Reasoning

## What Does the Word "Per" Mean?

The word per is often used when talking about rates. Here are some examples:
15 dollars per hour $\quad 70$ heartbeats per minute 100 percent
Per means for each or for every. We use per a lot when we talk about driving.
Question: How fast was the car moving?
Answer: 65 miles per hour. This means the car went 65 miles for every 1 hour of driving.

Question: How much did the gas cost?
Answer: $\$ 3.00$ per gallon. This means you have to pay $\$ 3.00$ for each gallon of gas you put in your car.

Question: What is your car's gas mileage?
Answer: 25 miles per gallon. This means your car travels 25

The rates for driving speed, cost, and gas mileage above can be written in many ways:
speed
65 miles per hour
65 miles/hour
65 mph
cost
$\$ 3.00$ per gallon
3 dollars/gallon
\$3.00/gallon
gas mileage
25 miles per gallon
25 miles/gallon 25 mpg

1) Complete the following table for the rate of 65 miles per hour.

| Hours Driving | Distance Traveled |
| :---: | :---: |
| 1 | 65 miles $/ 1$ hour |
| 2 | 130 miles $/ 2$ hours |
| 3 |  |
| 5 |  |
| 10 |  |

2) Complete the following table for the rate of 25 miles per gallon. This is a measure of how far a car will travel with a certain amount of gasoline.

| Number of Gallons | Gas Mileage |
| :---: | :---: |
| 1 | 25 miles/1 gallon |
| 2 |  |
| 3 |  |
| 5 |  |
| 10 |  |

3) Complete the following table for the rate of $\$ 3.00 /$ gallon.

| Number of Gallons | Cost |
| :---: | :---: |
| 1 | $\$ 3.00 / 1$ gallon |
| 2 | $\$ 6.00 / 2$ gallons |
| 3 |  |
| 5 |  |
| 10 |  |

4) Look up the terms below in an online dictionary. What do they mean?
per annum:
per diem:
per capita:
percent:

Complete the following matching activity. Connect the quantity on the left with the quantity on the right. Then use the combined phrase to fill in the sentences below.

5) The doctor measured the patient's heart rate at 190 _ heartbeats per minute .
6) Kindergarten classes in Albany have an average of 19 $\qquad$ .
7) As of 2O24, Employers in New York City are required to pay a minimum wage of 16
$\qquad$ .
8) Americans consume about 270 $\qquad$ each year.
9) To understand driving distances in other countries, you can use the conversion rate of 1.6 $\qquad$ .
10) Moderately active women between 31 and 50 years old should consume a maximum of 2,000 $\qquad$ , according to the Dietary Guidelines for Americans.
11) Packaged snacks often have three or more $\qquad$ .

## Ratios Written in Different Ways

Once you start looking for numbers written as ratios, you will see them everywhere. Here are some examples from recent news reports:

- More than 1 in 4 high school students are vaping (using e-cigarettes). About 1 in every 10 middle school students currently vape. (Dec. 2019, U.S. News and World Report)
- 7 in 10 Americans surveyed say they are still concerned about rising prices for everyday purchases, down from $83 \%$ in the summer of 2022. (Feb. 2024, PR Newswire)
- About $\frac{3}{5}$ of the New York City high school graduating class of 2018 enrolled in higher education, such as college or a vocational program. (Nov. 2019, Chalkbeat.org)
- Playing for the Houston Rockets basketball team, James Harden has made 87\% of his free throws this season. (Dec. 2019, SportingNews.com)
- With a batting average of .335, Tim Anderson of the Chicago White Sox had the best hitting percentage in major league baseball in 2019. (Dec. 2019, ESPN.com)

Each of these values are written in different ways, but they are all ratios:

$$
\begin{array}{lllll}
1 \text { in } 4 & 1 \text { in every } 10 & \frac{3}{5} & 87 \% & 0.335
\end{array}
$$

12) Use a newspaper, advertisements, television, or the Internet to find three examples of numbers written as ratios.
13) Write one of the ratios in other ways. For example, if it is a percent, change it to a fraction. Or if it is a fraction, change it to an equivalent fraction.

## The Language of Proportional Reasoning - Answer Key

## What Does the Word "Per" Mean?

1) 

| Hours Driving | Distance Traveled |
| :---: | :---: |
| 1 | 65 miles $/ 1$ hour |
| 2 | 130 miles $/ 2$ hours |
| 3 | 195 miles $/ 3$ hours |
| 5 | 325 miles $/ 5$ hours |
| 10 | $650 / 10$ hours |

2) 

| Number of Gallons | Gas Mileage |
| :---: | :---: |
| 1 | 25 miles/1 gallon |
| 2 | 50 miles/2 gallons |
| 3 | 75 miles/3 gallons |
| 5 | 125 miles/5 gallons |
| 10 | 250 miles/10 gallons |

3) 

| Number of Gallons | Cost |
| :---: | :---: |
| 1 | $\$ 3.00 / 1$ gallon |
| 2 | $\$ 6.00 / 2$ gallons |
| 3 | $\$ 9.00 / 3$ gallons |
| 5 | $\$ 15.00 / 5$ gallons |
| 10 | $\$ 30.00 / 10$ gallons |

4) We recommend Merriam-Webster.com, since it gives examples of words used in sentences. You could also use Dictionary.com. What did you find out?

5) heartbeats per minute
6) students per class
7) dollars per hour
8) eggs per person
9) kilometers per mile
10) calories per day
11) serving per container

## Ratios Written in Different Ways

1) Answers will vary. Please share the ratios you found with us. Email: Eric (eric.appleton@cuny.edu) and Mark (mark.trushkowsky@cuny.edu)
2) Answers will vary.

## Vocabulary Review

You can use this section to look up words used in this math packet.
area (noun): The size of a flat surface, measured by counting squares.
equivalent (adjective): Equal in value. Example: $\frac{1}{2}$ and 0.5 are equivalent.
multiple (noun): A number that can be divided by another number evenly, with no remainder. 25 is a multiple of 5 .
number line (noun): A picture of a straight line on which all numbers can be placed. Numbers get bigger as you move to the right and smaller as you move to the left.
fraction (noun): A part of a whole amount. $\frac{1}{2}$ or "one half" is an example of a fraction.
The top number (numerator) shows how many parts we have. It is the value of the "part" in a part-whole relationship.

The bottom number (denominator) says how many equal pieces the whole is divided into. It is the value of the "whole" in a part-whole relationship.
per (preposition): for each, for every

- The car was traveling 40 miles per hour.
- Most showers use 2.1 gallons of water per minute.
- The taxi charges $\$ 2.75$ per mile.
- The air pressure in your car tires should be 32-35 pounds per square inch.
percent (noun): A percent is a part-whole ratio which is "out of" 100. Per- means "for every" and -cent means "100," so the word percent literally means "for every 100 ." For example, " 5 percent" means " 5 for every 100 ." We use the symbol \% to show percent.
product (noun): The result of multiplication. 4 times 5 gives a product of 20.
proportion (noun): a statement that two ratios or fractions are equivalent. This is an example of a proportion: $\frac{12 \text { inches }}{1 \text { foot }}=\frac{36 \text { inches }}{3 \text { feet }}$. It can also mean a proper or equal share or the size of something compared to something else.
disproportionate (adjective): Larger or smaller size, share, or cost than we expect
rate (noun): A ratio that compares two different quantities, such as miles and hours (speed) or dollars and pounds (price).
- The sink was leaking at a rate of $1 / 2$ an ounce of water per minute.
- The train traveled at a rate of 80 miles per hour.
- The hybrid car gets a gas mileage rate of 50 miles per gallon.
ratio (noun): A comparison between two or more numbers using multiplication or division. It is a relationship between two quantities.

A part-whole ratio compares part of a quantity to the whole quantity. Example: 9 right-handed people out of every 10 people

A part-to-part ratio compares part of a quantity to another part of the quantity. Example: 1 left-handed person for every 9 right-handed people.
sequence (noun): A sequence is a list of things in order. Often, a sequence is a list of numbers in order.
series (noun): A group of things that come one after another
set (noun): A collection of things
term (noun): A number (or other quantity) that is part of a series
unit rate (noun): A unit rate shows how much of something per 1 unit of something else. Examples: $\$ 0.50$ per orange, 65 miles per hour, and 25 students for every teacher.
unit price (noun): The cost for one item or for one unit of measure. A unit price is a unit rate that shows the price of something.
